

January 2018 Star Chart for Honolulu, HI

How to use this star chart

The star chart shows the night sky above Honolulu on the 15th of the month at 10PM local time (HST). The constellations are labeled and their outlines will help you find them. Hold the chart overhead and rotate the page so the direction you are facing is at the bottom of the horizon circle. The center of the chart corresponds to the point directly overhead called the "zenith". The circle represents the horizon, with stars inside the circle above the horizon. Stars that are east of the horizon circle (blue background) are visible earlier in the month/evening. Those to the west are visible later.

Visible this month

Jupiter and Mars are visible in the predawn sky about 2 degrees apart. Jupiter is much brighter than Mars which can be recognized by its reddish color. Uranus and Neptune are in the western sky. This month's big event will be the total lunar eclipse on Jan. 31 that will be visible from Hawai'i.
