The star chart includes only the brightest stars to avoid cluttering the chart. The constellations are labeled, and the lines connecting their stars will help you find these celestial groupings.

March Skies
Mercury, Venus, and Mars are visible in the morning sky. Jupiter is visible in the evening, while Saturn rises in Libra and is visible in the morning. During the second week of March, Uranus appears to be too close to the Sun for observation. Neptune (in Aquarius) reappears in mid-March in the morning sky.

Join us for this special event.

March Moon Phases
- First Quarter: March 8
- Full Moon: March 18
- Last Quarter: March 23
- New Moon: March 30
