

March 2019 Star Chart for Honolulu, HI

How to use this star chart

The star chart shows the night sky above Honolulu on the 15th of the month at 10PM local time (HST). The constellations are labeled and their outlines will help you find them. Hold the chart overhead and rotate the page so the direction you are facing is at the bottom of the horizon circle. The center of the chart corresponds to the point directly overhead called the "zenith". The circle represents the horizon, with stars inside the circle above the horizon. Stars that are east of the horizon circle (blue background) are visible earlier in the month/evening. Those to the west are visible later.

Visible this month

The planets Jupiter, Saturn and Venus are best seen in the morning sky before twilight. Jupiter rises first, followed by Saturn, then Venus just before sunrise. Antares ruddy glow can be found near Jupiter all year as it reaches opposition on June 10th. Mercury returns to the western sky soon before sunrise. In the evening, looking west in late March, watch 1st mag. Mars make a close approach to the nearby Pleiades.
