

# April 2018 Star Chart for Honolulu, HI

## How to use this star chart

The star chart shows the night sky above Honolulu on the 15th of the month at 10PM local time (HST). The constellations are labeled and their outlines will help you find them. Hold the chart overhead and rotate the page so the direction you are facing is at the bottom of the horizon circle. The center of the chart corresponds to the point directly overhead called the "zenith". The circle represents the horizon, with stars inside the circle above the horizon. Stars that are east of the horizon circle (blue background) are visible earlier in the month/evening. Those to the west are visible later.

## Visible this month

Mars brightens in the early morning sky throughout the month at magnitude 0.3. Compare the color of Mars with nearby Saturn, shining in Sagittarius at magnitude 0.4. Venus is visible after sunset in the western sky but Jupiter dominates the night sky at magnitude -2.5, rising before midnight. Comet C/2016 R2 (PANSTARRS) is at magnitude 10-11 as it leaves Perseus for Auriga. The dwarf planet Ceres can be found in the constellation Cancer.
