

# April 2019 Star Chart for Honolulu, HI

## How to use this star chart

The star chart shows the night sky above Honolulu on the 15th of the month at 10PM local time (HST). The constellations are labeled and their outlines will help you find them. Hold the chart overhead and rotate the page so the direction you are facing is at the bottom of the horizon circle. The center of the chart corresponds to the point directly overhead called the "zenith". The circle represents the horizon, with stars inside the circle above the horizon. Stars that are east of the horizon circle (blue background) are visible earlier in the month/evening. Those to the west are visible later.

## Visible this month

On the 11th, Mercury is at its greatest western elongation at 28° west of the Sun. Neptune, mag. 8, can be found near Venus in the predawn sky. Saturn is also a predawn object visible in Sagittarius. Mars, at 1.5 mag. is high in the west after sunset near the M45, the Pleiades. After midnight, Jupiter shines at -2.3 mag. The Lyrids reach their peak on April 22/23.
