

May 2018 Star Chart for Honolulu, HI

How to use this star chart

The star chart shows the night sky above Honolulu on the 15th of the month at 10PM local time (HST). The constellations are labeled and their outlines will help you find them. Hold the chart overhead and rotate the page so the direction you are facing is at the bottom of the horizon circle. The center of the chart corresponds to the point directly overhead called the "zenith". The circle represents the horizon, with stars inside the circle above the horizon. Stars that are east of the horizon circle (blue background) are visible earlier in the month/evening. Those to the west are visible later.

Visible this month

Venus shines brightly in the west after sunset while Jupiter, at opposition on May 8-9, dominates the night sky. In the predawn hours both Mars and Saturn are visible in the eastern sky as Mars leaves Saturn and Sagittarius for Capricornus. When Mars reaches opposition in July it will be the brightest opposition since 2003. The dwarf planet Ceres can now be found between Cancer and Leo.
