Does intelligent life exist beyond Earth?

If so, how might we find it? Using the tools of astronomers, SETI, the search for extraterrestrial intelligence is systematically looking for evidence of technologies produced by distant, alien civilizations. The SETI Institute uses the Allen Telescope Array to explore the thousands of exoplanets being found by the Kepler spacecraft and ground-based observatories and to discover whether some of those potentially habitable worlds might actually be inhabited. Find out what we've learned and what's next.
